Skateboard Specific Issues

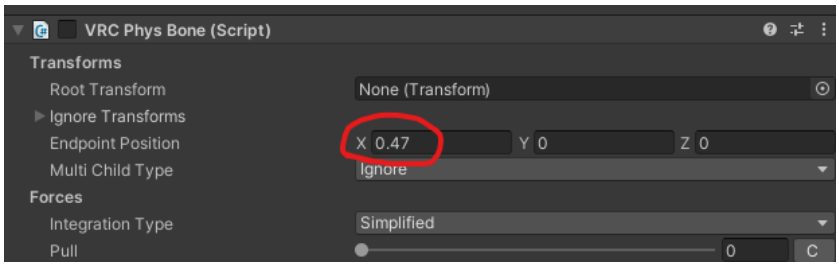

These issues are specific to the skateboard. Common issues later in the document.

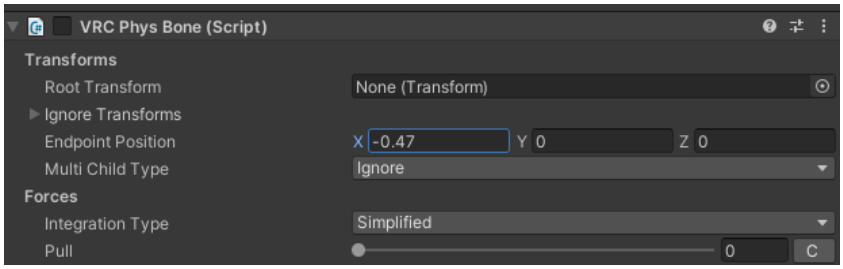

Board is rotating in the wrong direction (half body/desktop)

I haven't figured out what causes this, it seems to be inconsistent between avatars

To fix, simply invert the End Point values of the **SB_Rotator**

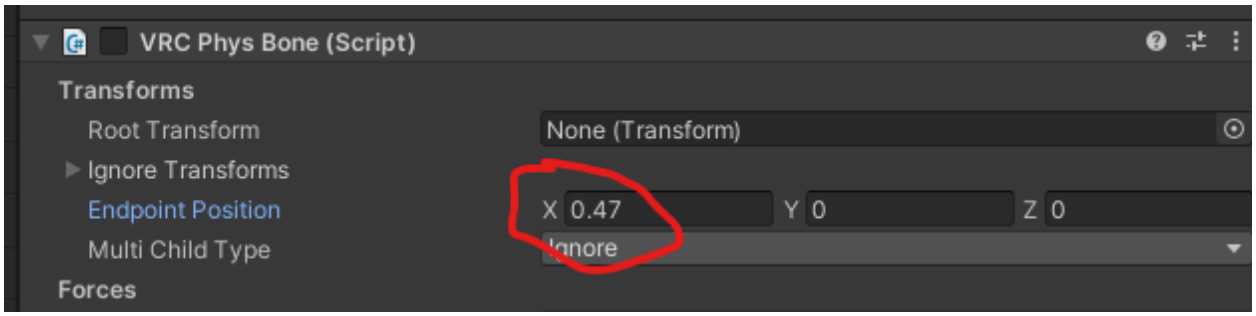

Board rotates too slow

This is more a personal preference. I put it to a value that felt right for me, but you can change it!

Change this value-
Higher = slower
Lower = faster

In FBT I don’t see the animations

Make sure you have Locomotion turned on in your quick menu

I’m getting a script error when trying to upload

Make sure you have the Final IK stub installed into your project
https://github.com/VRLabs/Final-IK-Stub

Common issues
Credit to **Liindy** for these common issue guides!

Cannot grab asset

Most of my assets rely on contacts for you to grab them.

And to grab you always have to do a fist gesture while your hand is inside the grabbing contact.

Reason 1: You may have gestures or self interaction turned off in the game, ensure those are on

Reason 2: rarely, some avatars have been found to not have a default hand contact. Use the ingame contacts overlay and check if your hand has finger and hand contact
